# Robo Retriever

Computer Architecture Project

A. Merkushova, J. Käser, M. Groenen, R. Kempf

Fall 2024

- **Goal:**

- Develop a quadruped four-legged robotic pet controlled via Wi-Fi

- **Steps:**

- Design parts and print them
- Design electronics and solder
- Assembly and calibration
- Programming

- Legs
- Shoulder
- Main body

- Too perfect fit
- Not good enough fit
- Belt slipping
- Servo mount slightly off
- Belt distance management
- ...

## Inverse Kinematics

- Leg movement by specifying the desired coordinates  $(x, y, z)$  and calculating the angles.

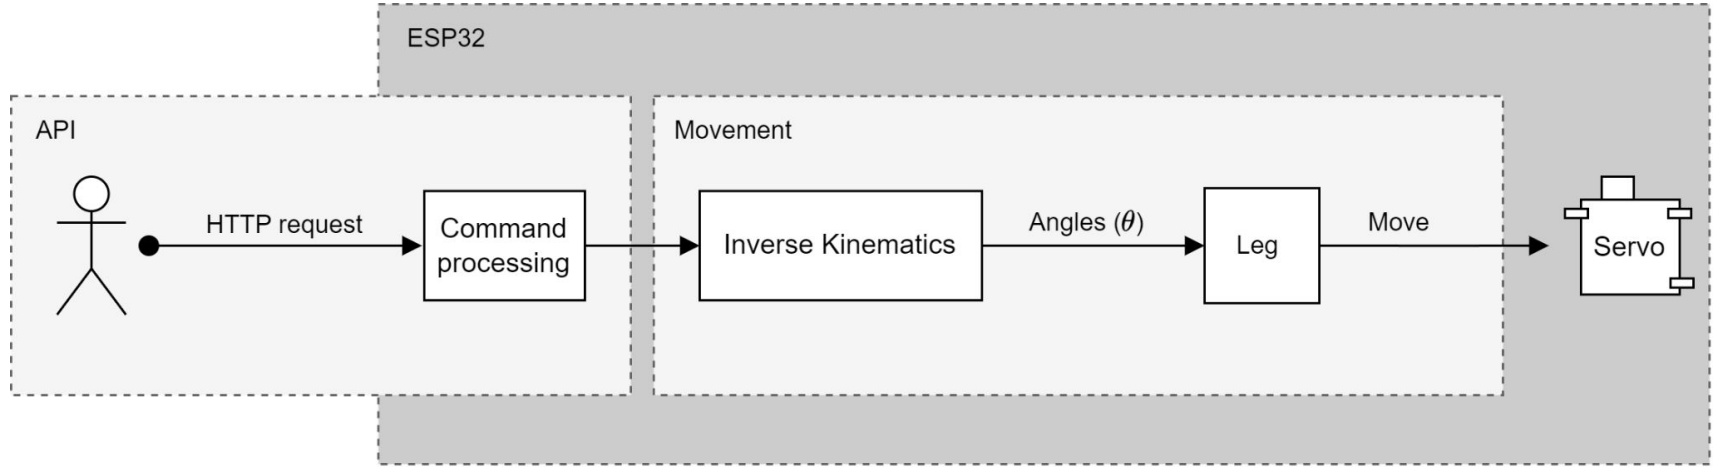

## Implementation

- Implemented in C++
- Angle calculations
- Each leg governs over its servos, allowing for individual movement

## Wi-Fi

- Async HTTP Server for remote control of the robot

- Stand up / Sit
- Tilt forward and backwards
- Walk forwards

- **Results:**

- Functional 3D design
- Electronic setup capable of controlling multiple servos
- Basic movement

- **Future Work:**

- Refine 3D design for stability
- Include rechargeable battery
- Optimize walking
- Remote Control with Interface
